Product Designer · Decision-Driven Workflows · Interaction Systems

SUMMARY

Product designer who works at the intersection of complex workflows, user decision-making, and system design. I don't just design screens — I map decision points, define interaction logic, and build systems that reduce cognitive load at the moments that matter most. Currently building SafeNav, a decision-driven travel planning system that rethinks how users evaluate trade-offs across safety, timing, and multi-stop coordination. B.Tech Computer Science (Data Science) at SRM Institute; 7 months of end-to-end UX practice in a product environment.

SKILLS

Product Design End-to-end product design, interaction design, information architecture, user flows, decision-system design

Research Methods User interviews, usability testing, journey mapping, heuristic evaluation, competitive analysis, scenario analysis

Design Thinking Human-centered design, context-aware design, decision-driven design, problem framing & validation

Tools Figma, FigJam, Miro, Notion

Technical Python (data analysis), PRD documentation, requirement analysis

PROJECTS

SafeNav — Decision-Driven Travel Planning System — Figma, FigJam, Miro, Notion

JULY 2025 – JAN 2026

- Identified through competitive analysis of 6 travel apps that no existing tool unified safety context, multi-stop coordination, and real-time decision-making into a single workflow — users were switching between 3–5 apps to complete a single trip plan.
- Defined SafeNav's core design thesis: travel planning is a decision problem, not a navigation problem — reframed the product around a continuous 4-stage loop (Explore → Contextualize → Plan → Navigate) to reflect how users actually evaluate and commit to travel decisions.
- Designed a map-centric interaction model where the map surface dynamically shifts roles across the 4 stages — reducing context-switches from 5 (cross-app) to 1 (single surface) and eliminating the need for users to mentally transfer state between tools.
- Built a time-sensitive decision layer that surfaces safety signals, transport options, and scheduling constraints inline at the point of decision — enabling users to evaluate not just destination, but when and how to move safely across multi-stop routes.

EXPERIENCE

UI/UX Designer — Intern — Sure Trust (Remote)

Jun 2025 – Jan 2026

- Owned end-to-end design across 3 sprint cycles — from user research and persona synthesis through interaction design, high-fidelity prototyping, and moderated usability testing — closing identified usability failures before each handoff.
- Restructured user flows and information architecture for digital interfaces, collapsing redundant decision points to reduce task completion steps — validated through iterative testing before sprint sign-off.

- Authored product requirement documents (PRDs) in Notion that captured design rationale and resolved conflicting stakeholder interpretations — adopted as the team's design brief across multiple sprint deliverables.
- Conducted heuristic audits across key product screens, surfacing severity-1 and severity-2 usability issues; prioritized critical fixes with the engineering lead and drove resolution within-sprint.

EDUCATION

B.Tech — Computer Science & Engineering (Data Science) — SRM Institute of Science and Technology, Kattankulathur *Aug 2023 – May 2027*
CGPA: 7.85 / 10.0 · Relevant: Human-Computer Interaction, Machine Learning, Software Engineering, Probability & Statistics
